Mental illness is predicted to afflict one out of every four people worldwide at some point in a person’s life. Mental illness has a positive correlation to the development of chronic health problems and can be blamed for 30% of years of life lost worldwide. Mental health care requires specialized staff and separate hospitals to treat patients and there is a large stigma associated with mental illness. The WHO classifies Ghana as a lower middle-income country (LMIC), but Ghana fails to meet many of the average statistics of other LMICs in terms of mental health care. Ghana struggles with inadequate facilities and human resources, uneven distribution of resources, and stigma associated with mental illness. In conjunction with the formal system of mental health care, the informal practice of care by religious and spiritual leaders plays a critical role in the care of the mentally ill in Ghana. Religion and spirituality are strongly associated with both the cause of mental illness as well as the treatment of mental illnesses. The following paragraphs will discuss the structure of the formal system of mental health care and address its shortcomings, they will discuss Christian and traditional religious ideas and how these beliefs and values pertain to mental health, and finally will discuss the implications of both systems playing an active role in communities.

In 2012 the Ghana legislature passed the “Mental Health Law” aimed at updating standard practice to conform to international ideas of “best practice standards for mental health practice and legislation.” The law reorganized the bureaucratic organization of mental health care in order to make mental health care more of a priority with the Ghana Health Services and more integrated within the Ministry of Health. The law, following the advice of current research, emphasizes community-level facilities and interventions rather than institutional facilities such as state-sponsored mental hospitals. The new law has promised to drastically improve the status of psychiatric patients in Ghana; however, it may take a long time to fully implement the policy. In the meantime, many patients fall through the cracks.

In Ghana, large numbers of mentally ill people go untreated and the distribution of resources is uneven by region. There is no comprehensive data available on the prevalence of mental illness, but it is estimated that ten percent of a given population is afflicted with mental illness, which is 2.4 million people. In 2012, the Kintampo Project conducted a comprehensive study of the mental health system to assess mental health services of the previous year. In 2012, 67,780 people were treated for mental illness in a clinical setting, which equates to 236 per 100,000 people in population; LMICs’ average is 688 per 100,000 people. In short, “If you are a Ghanaian with a mental illness, there is only a two percent chance you’ll receive any treatment. Local mental health services simply don’t exist for most people.” There are three mental hospitals in Ghana, all located along the southern coast in the Greater Accra (G/A) and the central regions. The density of psychiatric beds in the G/A region is 7.3 times that of the rest of the country. The number of beds made available to psychiatric patients by region declines drastically from the region with second most (central: 13.8/100,000) to third most (Ashanti: 2.1/100,000) and several regions reported having zero psychiatric beds. The upper east region ranks third, the upper west region fourth, and the eastern region ranks fifth in the number of patients treated in outpatients per 100,000 (271, 265, 231 respectively) yet all three regions report having zero psychiatric beds. Human resources in mental health are sparse and poorly distributed by region and within the formal system itself.

The criteria for diagnosing mental illness varies person-by-person and culture-by-culture. Once diagnosed with a mental illness, a person can expect to face discrimination, whether overt or covert, throughout their lives. In Ghana, accepted religious and spiritual beliefs institutionalize the stigmatization of the mentally ill. To battle this stigma, and fight for the improvement of care for the mentally ill, it is necessary to understand the current situation of mental health care and to understand the cultural forces behind its stigmatization.

In conjunction with the formal system of mental health care, the informal practice of care by religious and spiritual leaders plays a critical role in the care of the mentally ill in Ghana.

The criteria for diagnosing mental illness varies person-by-person and culture-by-culture. Once diagnosed with a mental illness, a person can expect to face discrimination, whether subvert or advert, throughout their lives. In Ghana, accepted religious and spiritual beliefs institutionalize the stigmatization of the mentally ill. To battle this stigma, and fight for the improvement of care for the mentally ill, it is necessary to understand the current situation of mental health care and to understand the cultural forces behind its stigmatization.
There are eighteen psychiatrists (0.07/100,000) and 1,568 registered mental health nurses, making a total of 4.9 professionals per 100,000 people. In comparison, the total number of mental health professionals working per 100,000 people in other LMICs is 6. These mental health professionals are concentrated in certain regions without regard to the number of psychiatric patients that they treat. For example, the upper east region treats the third most psychiatric patients (371/100,000), yet has a relatively low number of mental health professionals (1.65/100,000). Meanwhile, the northern region treats the third smallest number of psychiatric patients (154/100,000) yet has a relatively high number of mental health professionals (3.21/100,000). This disconnect between available resources and the needs of the different regions is the result of poor governmental planning and not the result of predatory allocations of access of mental health services. Furthermore, the human resources and resources (beds) are generally located near urban centers, so inhabitants of rural regions are disproportionately affected by the lack of access to mental health care services. Human resources are also distributed unevenly throughout the system. A total of 67,732 people were treated for mental illness by the formal health care system in 2011. 5,744 of these people were treated in outpatient services, while the majority, 7,933 were treated in one of the three state-sponsored mental hospitals. Even though the majority of patients were treated in outpatient departments, only 287 registered mental health nurses (4%) worked in outpatient services, while the majority, 7,484 RNMs, worked at the mental hospitals.

Despite progressive public policy aimed at addressing the serious gaps in the treatment of the mentally ill, Ghana fails to deliver adequate access to mental health services. This failure is rooted in inadequate government funding. Only 1.4 percent of the total health budget was allocated to mental health services. Despite the limited allocation of this money, the government spent 10 percent of the total budget on mental health services. Ghana is one of the few countries with a mental health policy that addresses the need for adequate access to mental health services.

Despite the low percentage of people reporting mental illness and their treatment seeking behaviors, the religious and spiritual leaders treat mental illness at a community level. The religious ideas of the inhabitants of, or concurrently with, biomedical treatment. As the religious leaders often come from the same background as the psychiatric patients, it is important to understand how mental illness and the treatment of mental illness is perceived at a community level. The religious ideas of the religious leaders are a product of the misallocation of health care resources directly contradicts the goal of the new public policy, which is to expand the community-level facilities rather than the institutional facilities.

Working outside the formal system of mental health care, religious and spiritual leaders treat mental illness at a community level. Mental illness is deeply steeped in ideas of spirituality and divine intervention; many people wish to leave; however, “people are allowed to leave only when the prophet considered them ready to be discharged.” Unfortunately, for mental health patients in Ghana, these types of conditions were also found in state-sponsored mental institutions. However, in this case, the Mental Health Law promises to reform some issues like involuntary detention, chaining, and hygiene. The new law will have no effect on the treatment of the mentally ill in Christian prayer camps.

Traditional healers also play a large role in the informal primary care of mentally ill people. Traditional religion is an integral part of African culture because they allow people to identify with their ethnic origins and their family heritage. There are many different forms of traditional religion throughout the African continent but there are a few practices prevalent in society and are an important part of Ghanian culture. This is reflected in the popularity of syncretic religions, such as Pentecostal Christianity, which combine Christianity and ideas of spirituality common among traditional religions. In fact, Pentecostal and charismatic sects of Christianity make up the largest percent of Christians in Ghana at 28.3 percent. Portuguese traders first introduced Christianity to the people of Ghana during the 15th century. This early settlement had a long-lasting impact on Ghana, and many different sects of Christianity would soon follow. Western European traders and missionaries flocked to Ghana as it was in the 19th century, and the missionization arrived with educational reforms and western biomedical science. Thus, Christianity in Ghana has a long-standing relationship with medicine and healing. For example, Jesus himself is associated with healing. Jesus is described in the Bible as a healer, curing cases of leprosy and hemorrhage. Mark 5:25 illustrates the association between the Christian faith and healing: “Then Jesus answered and said to her, ‘O woman, great is your faith! Let it be to you as you desire.’”

In the 1920s, Christian prayer camps began to emerge to treat physical and mental ailments. A religious idealist who is a self-proclaimed prophet with healing powers generally heads these prayer camps. According to the Human Rights Watch, “The main difference between prayer camps and the Catholic or Protestant churches, according to a Christian leader, is that prayer camps are more of charismatic and Pentecostal churches, and the relationships with medicine and healing. They hold that it had not been done to them in prayer camps in Ghana entitled “Like a Death Sentence: Abuses Against Persons with Mental Illness in Ghana.” In this region, over 90 percent of nursing homes are living quarters, but chaining inside and outdoors, lack of shelter, and the denial of food were conditions found to occur in many of the Christian prayer camps. In one prayer camp in the NGO, with patient from Mount Horeb Prayer Camp describes how “You can’t have a good bath with a chain. We shit here and there and don’t have a place to bathe every day. It smells a lot inside here. I don’t know when I will leave this place.” The Human Rights Watch reports, “Those who are not cured during prayer camps are forced to leave Mount Horeb Prayer Camps had to shower in the stalls where they slept and ate. Aisha, a 56-year-old woman at Mount Horeb Prayer Camp, expressed: ‘I bathe only two times a week, but I want to bathe every day.’” Mount Horeb prayer camp later reported to The Lancet that it had not used chains for years, contradicting the overwhelming evidence against this claim. These types of practices are not conducive to treating mental illness, and many people wish to leave; however, “people are allowed to leave only when the prophet considered them ready to be discharged.” Unfortunately, for mental health patients in Ghana, these types of conditions were also found in state-sponsored mental institutions. However, in this case, the Mental Health Law promises to reform some issues like involuntary detention, chaining, and hygiene. The new law will have no effect on the treatment of the mentally ill in Christian prayer camps.

Traditional healers also play a large role in the informal primary care of mentally ill people. Traditional religion is an integral part of African culture because they allow people to identify with their ethnic origins and their family heritage. There are many different forms of traditional religion throughout the African continent but there are a few practices prevalent in society and are an important part of Ghanian culture. This is reflected in the popularity of syncretic religions, such as Pentecostal Christianity, which combine Christianity and ideas of spirituality common among traditional religions. In fact, Pentecostal and charismatic sects of Christianity make up the largest percent of Christians in Ghana at 28.3 percent. Portuguese traders first introduced Christianity to the people of Ghana during the 15th century. This early settlement had a long-lasting impact on Ghana, and many different sects of Christianity would soon follow.

themes, beliefs, and values that are common among most traditional religions. These include: the belief in a supreme, omnipotent God, the removal of the supreme God from daily worship, the idea that lesser gods take residence in objects, the belief in the divine or spiritual essence of the spirits of the ancestors, the idea that the spirit world of the ancestors is as real as the living world, and the roles of chiefs, elders, and spiritual leaders in balancing the spiritual and the living world. These common themes reflect a strong belief in spirituality and direct, tangible action by the Gods. A product of this belief system is the perception of diseases as the result of divine intervention. As a result, traditional religious and spiritual leaders assume the duty of treating illness, both physical and mental.

Komla Tsey identifies three major paths to becoming a traditional healer: to either become a traditional healer through an apprenticeship, self-learning, or because of a "calling." Rather than categorizing healers based on how they became healers, it is useful to recognize the traditional healer based on whether or not they practice "spiritually based" or "non-spiritually" based healing. Spiritually based healing includes receiving a calling from the gods beckoning them to the practice, while non-spiritually based practitioners report rational reasons like the need for supplemental income.24 It is the purview of the spiritually based healers to treat mental illness. Spiritual healers report consulting the Gods for treatment advice for each new case they receive.25 It is the purview of spiritual healers, mental illness is a "possessions by evil spirits. They [mental illnesses] are ‘disturbances in the relationship between people and divinity, [and] divine punishment for past actions.’"26 Thus, the treatment of mental illness by these spiritual healers often focuses on driving out evil spirits through worship, ritual, and herbal remedies.

The conditions and human rights status of patients of traditional healers is less researched because they tend to operate on a much smaller, local scale than the Christian prayer camps. While both operate at the local level, Christian prayer camps do so on a larger scale and can be seen as more regional treatment centers. Traditional healers are more active at the village level and tend to limit the number of patients treated, mainly due to time and resource restraints. Additionally, Christian prayer camps almost always involve the admission of patients into residential units, oftentimes indefinitely. This exposes Christian prayer camps to committing human rights abuses associated with unhygienic conditions and cramped living quarters because of the financial incentive to admit as many patients as possible. The consultation of a religious or spiritual leader.

Both types of informal care provide spiritual and religious treatment for psychological disorders, supplying a strong demand for such treatment of mental illness. The current formal system of mental health care is quite inadequate to mentally ill patients on a community level, so the Christian and spiritual healers occupy an important part of the primary care of mental health patients. In addition to the demand created by a lack of biomedical resources, many people will choose to visit a traditional healer or a spiritual healer for a variety of reasons. This decision may stem from financial reasoning, but oftentimes it is because of religious and cultural beliefs. The spiritual nature of disease and the power of miracles are common beliefs that cause people to view mental illness as the product of divine intervention (which a hospital will not be able treat) which necessitate the consultation of a religious or spiritual leader.

Inadequate or improper systems of care place a strong economic burden on societies.28 The government allocates 1.4% of the national health budget, or GHS 4,516,163, for mental health expenditures; however, the real cost to society is derived from "lost employment and reduced productivity, impact on families and caregivers, levels of crime and public safety, and the negative impact of premature mortality."29 Mental illnesses are positively correlated with greater risks of developing chronic illnesses, experiencing acute health problems, and substance disorders, placing further burden on the public insurance system of Ghana.30 It is in the best interest of politicians and government officials to address the inadequate system of mental health care because it is contributing to a significant drain on government resources. This introduces the question, what can be done to improve the conditions and health of the mental health patients in Ghana?

From an economic standpoint, it is clear that Ghana will have to spend more money on the formal mental health care system if it is to carry out the new policy dictated by the Mental Health Law and expand services on a community level. The Ghanaian government offers free public health insurance and guarantees all mental health services at public hospitals. Where can the funding come from? Some western organizations and nations might argue that the best way is to privatize the system and allow investment from outside sources. People of the Ghanaian government and health care administration might say that they need more money in aid. The reality is that government policies might have advantages and disadvantages. Privatization would take the burden off of the federal government, but could lead to expensive health care and cause many people to be unable to afford health care. Aid will help finance the initiative but is a short-term solution to a chronic problem. Keeping an aid program going for a necessary social service leads to chronic dependence on aid which will hurt the Ghanaian government in the long run. However, another solution to enhance the initiative, they should make use of pre-existing community resources (traditional and Christian healers) by integrating the informal system into the formal system.

The government should begin regulating clinics by mandating that clinics and the clinics employees register with the government. This will allow the government to maintain an oversight over the clinics to ensure that no human rights abuses or maltreatment of these patients in Ghana?

Inadequate or improper systems of care place a strong economic burden on societies. The government should begin regulating clinics by mandating that clinics and the clinics employees register with the government. This will allow the government to maintain an oversight over the clinics to ensure that no human rights abuses or maltreatment of these patients in Ghana?

It is important to consider the cultural environment in which policy and interventions are being enacted. There are many other players besides the government working to improve the conditions and health of the mental health patients in Ghana, which include NGOs from western nations. Western nations tend to have greater faith in biomedical science than religion, and so their initiatives will promote medical care over religious treatment. But is this what local communities need? Mental illness is a unique field of

themes, beliefs, and values that are common among most traditional religions. These include: the belief in a supreme, omnipotent God, the removal of the supreme God from daily worship, the idea that lesser gods take residence in objects and places, the recognition of the spirits of the ancestors, the idea that the spirit world of the ancestors is as real as the living world, and the roles of chiefs, elders, and other political leaders in balancing the spirit and the living world. These common themes reflect a strong belief in spirituality and direct, tangible action by the gods. Among the sources of stress is the perception of disease as the result of divine intervention. As a result, traditional religious and spiritual leaders assume the duty of treating illness, both physical and mental.

Komi Tsey identifies three major paths to becoming a traditional healer: the spirit-based healer, self-learning, or becoming a "caring." Rather than categorizing healers based on how they became healers, it is better to recognize the traditional healer based on whether or not they practice spiritually based or non-spiritually based healing. Spiritually based healer is one who received a calling from the gods beckoning them to the practice, while non-spiritually based practitioners report rational reasons like the need for supplemental income. It is the purview of the spiritually based healers to treat mental illness. Spiritual healers report consulting the Gods for treatment advice for each new case. On the other hand, non-spiritual healers are likely to have a more spiritual practice. Patients are seen as joining the healer's extended family.

Both types of informal care provide spiritual and religious treatment for psychological disorders, supplying a strong demand for such treatment of mental illness. The current formal system of mental health care is inconvenient and inadequate to mentally ill patients on a community level, so the Christian and spiritual healers occupy an important position in the primary care of mental patients. In addition to the demand created by a lack of biomedical resources, many people will choose to visit a Christian or traditional healer first before going to a hospital. This decision may stem from financial reasoning, but oftentimes it is because of religious and cultural beliefs. The spiritual nature of disease and the power of miracles are common beliefs that cause people to view mental illness as the product of divine intervention (which a hospital will not be able treat) which necessitate the consultation of a religious or spiritual leader.

Inadequate or improper systems of care place a strong burden on religious treatment. However, the real cost to society is derived from "lost employment and reduced productivity, impact on families and caregivers, levels of crime and public safety, and the negative impact of premature mortality." Mental illnesses are positively correlated with greater risks of developing chronic illnesses, experiencing acute health problems, and substantial morbidity, placing further burden on the public insurance system of Ghana. It is in the best interest of politicians and government officials to address the inadequate systems of mental health care because it is contributing to a significant drain on government resources. This introduces the question, what can be done to improve the conditions and health of the mental health patients in Ghana?

From an economic standpoint, it is clear that Ghana will have to spend more money on the formal mental health care system if it is to carry out the new policy dictated by the Mental Health Law and expand services on a community level. The Ghanaian government offers free public health insurance and guarantees all mental health care services will be funded. The question is: where will the money come from? Some western organizations and nations might argue that the best way is to privatize the system and allow community resources to expand the coverage base. People of the Ghanaian government and health care administration might say that they need more money in aid, for the government's service will face major challenges. Advantages and disadvantages. Privatization would take the burden off of the federal government, but could lead to expensive health care and cause many people to be unable to afford health care. Aid will help finance the initiative but is a short-term solution to a chronic problem. Keeping a balance between the two could be the most necessary solution. For a necessary social service leaders to chronic dependence on aid which will thwart the Ghanaian government in the long run. However, it is imperative to recognize that the initiative, they should make use of pre-existing community resources (traditional and Christian healers) by integrating the informal system into the formal system. The government should begin regulating clinics by mandating that clinics and the clinics employees register with the government. This will allow the government to maintain an oversight over the clinics to ensure that no unethical or unethical systems of care programs to the people working in the clinics so that the patients are receiving the best possible care. Clinics that do not comply with regulation should be immediately shut down. Another possible solution is to form an association between regional hospitals and faith-based clinics. This would provide a bridge between formal care through the formal system, ensure the safety of patients of faith-based clinics, and create a system where people do not have to choose between faith and formal medicine.

It is important to consider the cultural environment in which policy and interventions are being enacted. There is a Christian presence in the primary care of mental patients in Ghana, which includes NGO's from western nations. Western nations tend to have greater faith in biomedical science than religion, and so their initiatives will promote medical care over religious treatment. But is this what local communities need? Mental illness is a unique field of...
medicine in that the diagnosis of psychological disorders are ambiguous, signs and symptoms vary across cultures, and the efficacies of treatments of certain disorders are widely debated. Westerners may promote the application of biomedical sciences to treat mental illness, but this may not always be the best course of action. Research has shown that patient satisfaction with treatment and care has led to better health outcomes. Stewart et al. showed that increased “patient-centered communication,” lead to better recovery, better emotional health, and less needs for further medical attention. If a patient wholeheartedly believes they are afflicted with a malevolent spirit then providing them with that course of treatment may be what is necessary (perhaps alongside biomedical treatment) for a positive health outcome. Western NGOs and other organizations working to enact interventions at a community level should keep in mind one thing: Africa is not worse, backwards, or behind Western culture; it is different and actions should reflect this by conforming to local culture and community needs.

“Africa is not worse, backwards, or behind Western culture; it is different and actions should reflect this by conforming to local culture and community needs.”

Gili Remen
