# The Oxidative Coupling of Methane: a Kinetic Model

by  
Lauryn Holgado

Adviser: Prof. Srinivas Rangarajan

Lehigh University

May 5, 2024

# Natural Gas and Ethylene Production

- Low-carbon solutions: conversion of natural gas to useful chemicals.
- Increasing natural gas production.
  - 2022: 28.6 trillion cubic feet (Tcf) shale gas produced in the U.S. (79% of total U.S. dry natural gas production).<sup>1</sup>

1. U.S. Energy Information Administration. (accessed 2023-12-06)

# Kinetic Model<sup>2</sup>

- 39 gas-phase reactions
- 14 surface reactions
- 33 species (gas-phase, surface, free radicals, inert gas)

2. SUN, J.; THYBAUT, J.; MARIN, G. Microkinetics of Methane Oxidative Coupling. *Catalysis Today* **2008**, 137 (1), 90-102. DOI:10.1016/j.cattod.2008.02.026.

# Python Script

$$\bullet V \frac{dC_A}{dt} = \begin{bmatrix} S^{gas} \\ S^{surf} \end{bmatrix} \begin{bmatrix} r^{gas} \cdot V_{gas} \\ r^{surf} \cdot cat\_SA \end{bmatrix}$$

$$\frac{d\theta}{dt} = S^{surf} r^{surf}$$

$$[*] = \sigma - \sum_i [\theta_i]$$

$V$  = total volume [m<sup>3</sup>]

$V_{gas}$  = gas volume [m<sup>3</sup>]

$C_A$  = gas phase species concentration matrix [mol m<sup>-3</sup>]

$S$  = reaction matrix (gas or surface)

$r$  = rate expression (gas or surface) [mol m<sup>-3</sup> s<sup>-1</sup> or mol m<sup>-2</sup> s<sup>-1</sup>]

$\sigma$  = active site density [mol m<sup>-2</sup>]

$cat\_SA$  = catalyst surface area [m<sup>2</sup>]

$\theta$  = adsorbed species concentration matrix [mol m<sup>-2</sup>]

- Solve a system of ODEs
- solve\_ivp
- Method: 'BDF' (backward differentiation formula)
- Example input

# Gas Phase Rate Constants

The forwards rate constant was calculated using the Arrhenius equation. The equilibrium constant relation was used in order to determine the backwards rate constant.

$$k_f = A_f \exp\left(-\frac{E_a^f}{RT}\right)$$

$$k_b = \frac{k_f}{K}$$

$$\Delta G^0 = \Delta H^0 - T\Delta S^0$$

$$\Delta G^0 = -RT \ln K$$

$A_f$  = pre-exponential factor  
[1/s or m<sup>3</sup>/mol s or m<sup>6</sup>/mol<sup>2</sup> s]

$E_a^f$  = activation energy  
[kJ/mol]

$K$  = equilibrium constant

# Surface Reaction Rate Constants

For adsorption steps, the following equation was used:

$$k = \frac{S_o}{\sigma^n} \sqrt{\frac{RT}{2\pi M}}$$

$S_o$  = the initial sticking probability

$\sigma$  = the density of active sites  
[mol/m<sup>2</sup>]

$n$  = reaction order

$M$  = the molar mass [kg/mol]

# Third-Body Modeling

- Implemented third-body modeling using and inert ( $N_2$ ) as the third body. Third body modeling is an integral part of this kinetic model.

# Catalyst

Sn/Li/MgO

- BET surface area =  $2800 \text{ m}^2/\text{kg}$
- Density =  $2300 \text{ kg}/\text{m}^3$
- Porosity = 0.27
- Areal density =  $1.14\text{e-}5 \text{ mol site}/\text{m}^2$

Assumed 100 mg of catalyst

- Catalyst surface area =  $0.28 \text{ m}^2$

# Conditions<sup>3</sup>

- $T = 750^{\circ}\text{C}$ ,  $P = 130 \text{ kPa}$
- Runtime = 0.0124 seconds
- CH<sub>4</sub> initial fraction = 0.1
- $\text{CH}_4/\text{O}_2 = 2$
- $[\text{CH}_4]_0 = 1.54 \text{ mol/m}^3$
- $[\text{O}_2]_0 = 0.77 \text{ mol/m}^3$
- $[\text{N}_2]_0 = 12.5 \text{ mol/m}^3$
- Reactor volume =  $3.27\text{e-}5 \text{ m}^3$
- Gas volume =  $3.19\text{e-}05 \text{ m}^3$
- Weight of Catalyst/Flowrate = 2 kg s/mol

DOI:10.1021/ie9504617.

# Conversion

- Very little conversion of both CH<sub>4</sub> and O<sub>2</sub>
  - Maximum conversion of CH<sub>4</sub> = 3.31e-5%
  - Maximum conversion of O<sub>2</sub> = 4.01e-5%

$$\text{Conversion} = \frac{C_{i,o} - C_{i,t}}{C_{i,o}} \times 100$$

$C_{i,t}$  = concentration of species i at time t

$C_{i,o}$  = initial concentration of

# Yield

- Very little yield for all species

$$yield = \frac{num\_mol\_CH4 \times C_{i,t}}{C_{CH4,0}} \times 100$$

num\_molCH4 = moles of CH4 required to produce species i

$C_{i,t}$  = concentration of species i at time t

$C_{CH4,t}$  = initial concentration of CH4

Species	Maximum Yield [%]
Ethane (C <sub>2</sub> H <sub>6</sub> )	2.69e-3
Ethylene (C <sub>2</sub> H <sub>4</sub> )	5.71e-7
Acetylene (C <sub>2</sub> H <sub>2</sub> )	3.23e-11
Propane (C <sub>3</sub> H <sub>8</sub> )	5.32e-12
Propylene	4.92e-11

# Increase Runtime

- Modify rate constants to create a less stiff reaction network
- Increased the runtime to 100 seconds

Maximum conversion of CH<sub>4</sub> =  
2.27%

Maximum conversion of O<sub>2</sub> =  
1.82%

Species	Maximum Yield [%]
Ethane (C <sub>2</sub> H <sub>6</sub> )	1.46
Ethylene (C <sub>2</sub> H <sub>4</sub> )	0.346
Acetylene (C <sub>2</sub> H <sub>2</sub> )	6.30e-4
Propane (C <sub>3</sub> H <sub>8</sub> )	1.53e-9
Propylene (C <sub>3</sub> H <sub>6</sub> )	0.029

# Future Directions

- Increase the amount of catalyst
- Model different types of reactors (PFRs, CSTRs, etc.)\
- Model UV-PIMS
- Compare to experimental data

Thank you!
